Date: June 25, 2026
Subject: **Action Required: Secure Pull Architecture - LLD Update & Ownership**

Hi Team,

Hope you are doing well.

As you are aware, we have finalized the Secure Pull Architecture framework covering our multi-layer security model for enterprise patching across all three datacenters. The architecture documentation and animated presentation are now available on our GitHub repository for reference:

Repository: <https://github.com/zohaibjaved181/Secure-Pull>

I need each of the following sections incorporated into the Low-Level Design (LLD) document with full technical detail. Please review and either confirm ownership for your area or assign someone from your team who will be responsible for documenting each section.

Sections Requiring LLD Documentation

#	Section	What is Needed in LLD
1	Patching Challenges	All products per DC (Networking, Collab, HCI, MS, Security, Monitoring), pain points, dependencies
2	Cybersecurity Reqs	Compliance mapping (ISO 27001, NIST, NCA ECC, PCI-DSS), patch SLA matrix, security controls
3	Risk & Lessons	Risk register for manual patching, failure scenarios, rollback procedures, mitigation strategies
4	Secure Pull (5 Layers)	Network diagrams per layer (Internet FW, Proxy, DMZ FW, DC FW, ACI), FW rules, IP whitelists
5	Update Types	Per-product mechanism (WSUS, Ivanti, Nutanix, Trellix, PAN, IAM/PAM/NAC, Collab), ports/protocols
6	Auto vs Manual	Risk classification, scheduling matrix, approval workflows, staged rollout, validation checklists
7	BeyondTrust PRA	PRA jump points, vendor onboarding, approval workflow, session policies, SIEM integration

What I Need From You

- Reply by [insert deadline] with the owner name for each section (yourself or a team member)
- If a section spans multiple teams, identify a primary owner and contributors
- Provide an estimated completion date for your section(s)
- Flag any dependencies or blockers that might delay documentation

Suggested Ownership (Please Confirm/Reassign)

Section	Suggested Owner	Team	Status
Patching Challenges at Scale	TBD	Infrastructure / Operations	Pending
Cybersecurity Requirements	TBD	Information Security / GRC	Pending
Risk & Lessons Learned	TBD	Security Operations / Risk	Pending
Secure Pull (5 Layers)	TBD	Network Security / Firewall	Pending
Update Types & Technologies	TBD	Endpoint / Patch Mgmt	Pending
Auto vs Manual Strategy	TBD	Change Mgmt / Operations	Pending
BeyondTrust PRA	TBD	IAM / Privileged Access	Pending

Important Notes

- The LLD should follow our standard template with network diagrams, config snippets, and validation steps

- Reference the animated architecture in the repository for visual flow understanding
- Each section must include rollback procedures and failure scenarios
- All firewall rules and IP whitelists should be documented in tabular format
- Coordinate with adjacent teams where sections overlap (e.g., Firewall + Network for Layer 5)

PRIORITY: HIGH - The Secure Pull model is critical to our patching posture across all three datacenters.

Please treat this as high priority. We need the LLD finalized to proceed with implementation and scheduling of the first patching cycle under the new architecture.

Let me know if you need a walkthrough of the architecture or have any questions.

Regards,
